As noted in the main manuscript, the versions of the CB05 and CBMIV mechanisms that are used in the NAQFC systems have been slightly modified from the original published versions. The rate coefficients of both mechanisms have been updated as necessary from their original published values. The CBMIV mechanism used in the NAQFC has been modified in four areas: (i) an unreactive organic nitrate product was added to reactions R55, R64, R68, R78, R81, R92 and R94; (ii) the original isoprene chemistry of CBMIV was replaced by the isoprene chemistry introduced in CB05; (iii) an $\text{SO}_2 + \text{OH} \rightarrow$ sulfate reaction was added (R82); and, (iv) additional peroxy radical – operator reactions were adopted from CB05 (R86-R89).

Table S-1: Definition of species used in the NAQFC implementations of the CBMIV and CB05 gas-phase chemical mechanisms.

SUN is the normalized sunlight intensity, scaled with simulation time to be  

1.0 at local noon and 0.0 at night. This simplification was used in the box  

model study reported here. In the NAQFC system, the usual CMAQ routines for  

generating photolytic rate constants are employed.
